

# Building Cross-Platform Apps with Capacitor & Angular

Mike Hartington | @mhartington

## **Mobile Development is hard**

Complex tools to learn

Vastly Different design languages

Multiple code bases to maintain

What about the web?

## **Goal**

Reuse Web skills for native

Reduce code that needs to be maintained

Reducd time to market (aka: SHIP IT)

**Starting to sound familiar...**

*If you've heard me speak before  
you know where I'm going*

Levels of abstractions

Let's assess the ecosystem

Pure Web

???

Pure Native

Cordova/Phonegap

"Compile" to Native

APACHE

**CORDOVA**™

## **Write once, run anywhere**

Web app that can deploy to native

Bridge between native and a browser

Polyfill for browser/webviews

## Only available with Cordova

```
navigator.camera.getPicture(  
  onSuccess, onFail,  
  {  
    quality: 25,  
    destinationType:  
      Camera.DestinationType.DATA_URL,  
  }  
);  
  
function onSuccess(imageData) { ... }  
function onFail(message) { ... }
```

Additional APIs provided by plugins

Custom package manager (pre-npm)

Complex build/release scripts

## **Things to keep in mind**

Web as a polyfil target

No need for Native IDEs

Native projects as dist targets

The other end of the spectrum

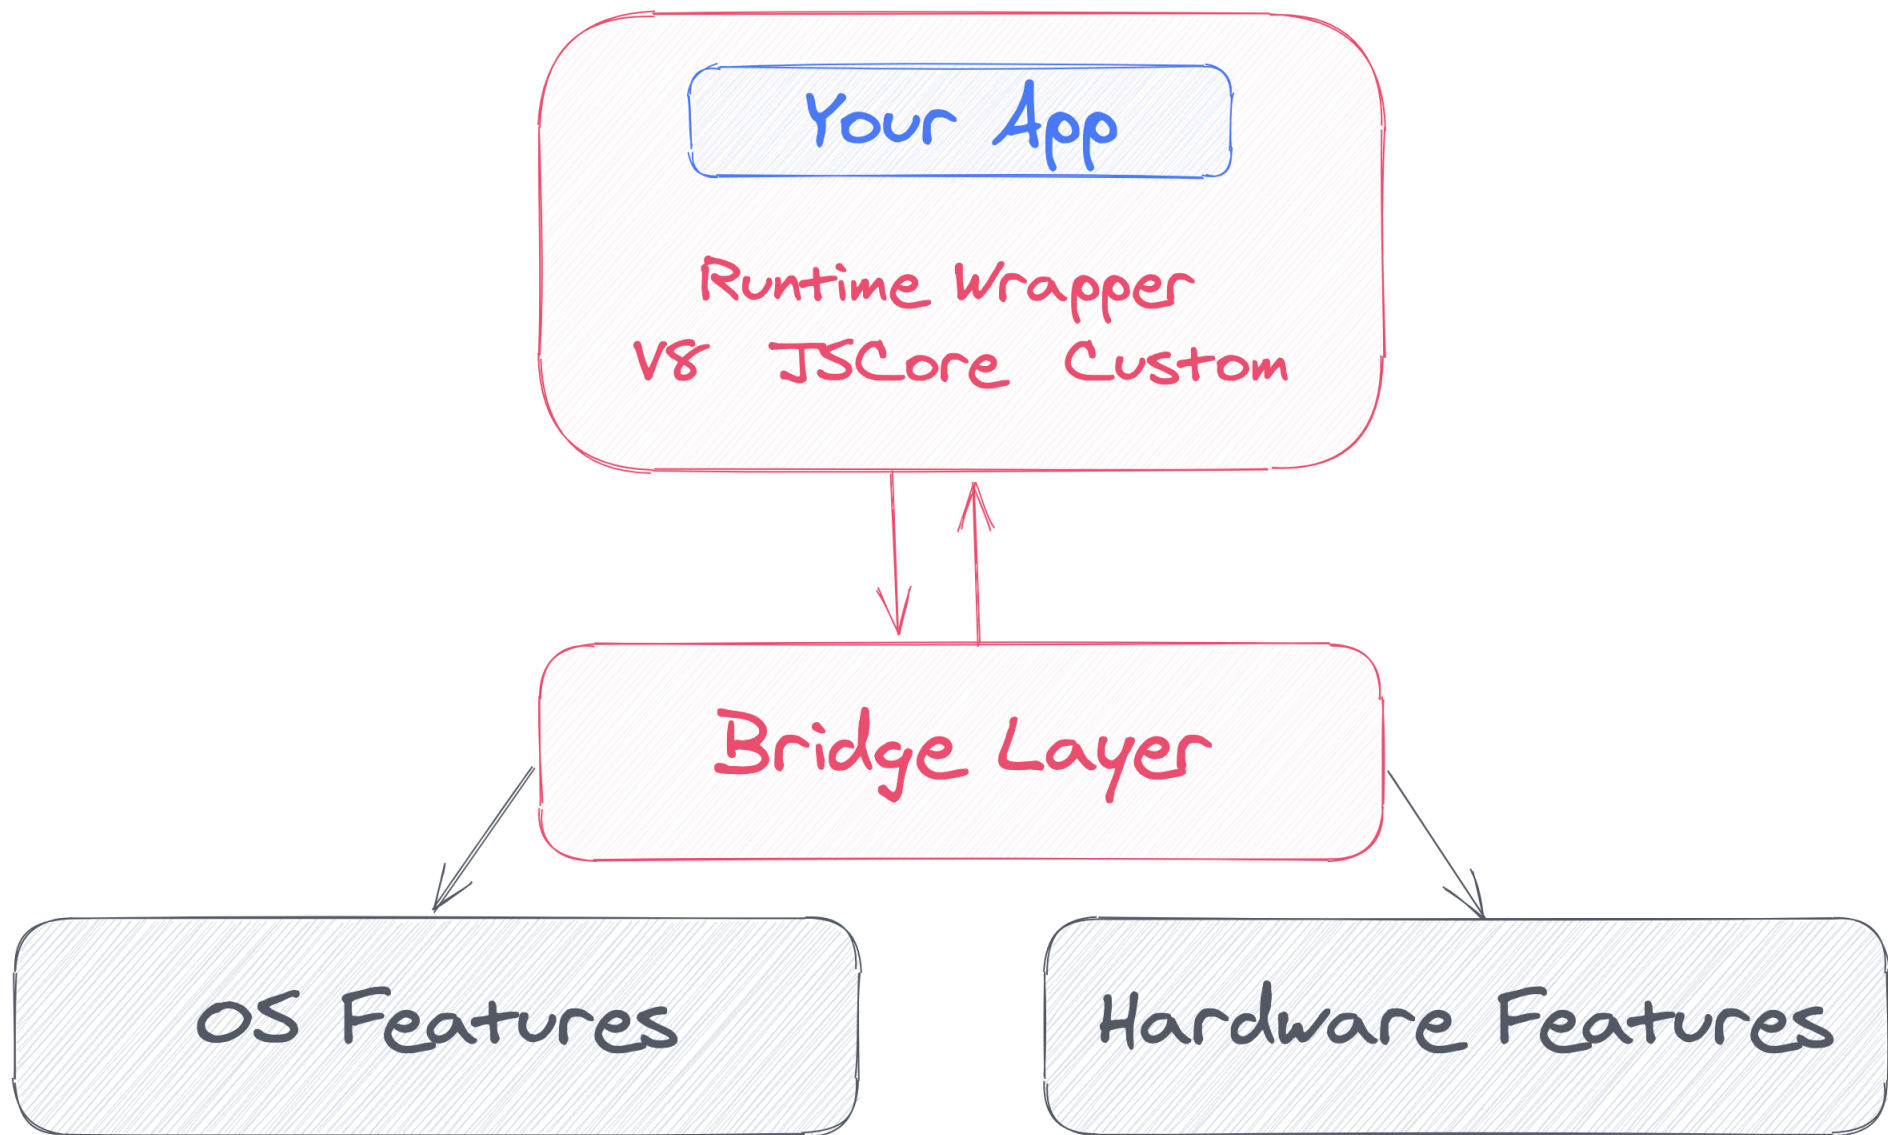

**"Compile" to Native**

## **"Learn one, write anywhere"**

Promise of "truly native" App

Abstractions around native controls

"Standard" lib around native APIs

## **Where it breaks down**

Different syntax/languages

Can't reuse existing web app

Limited third-party libraries

## **"Truely Native"**

A bit misleading

Controls are rendered on the fly

Created via custom renderer (non-native)

**Ok, so what else?**

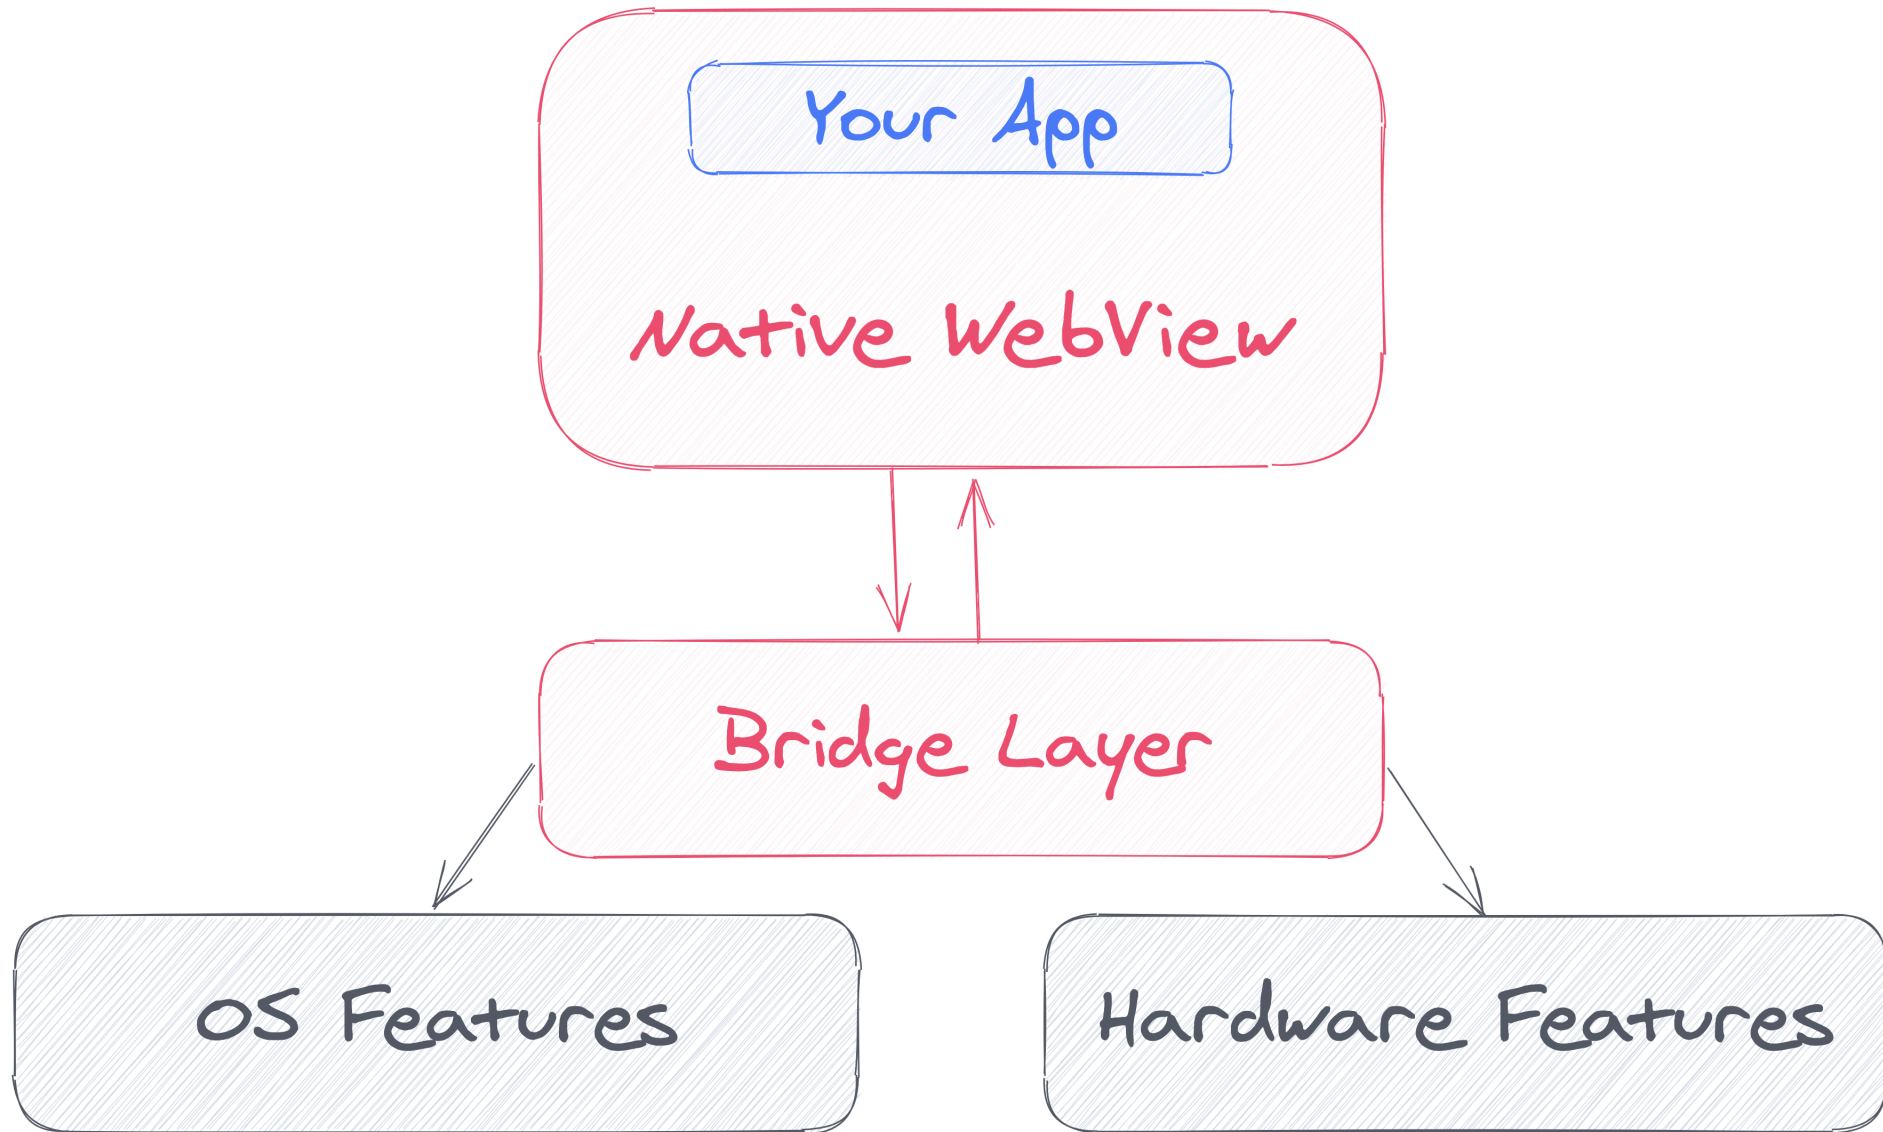

## **What is Cap?**

Native Runtime, JS library

Adaptive API that can handle cross platform

Standard native tooling instead of custom

**How is this different?**

Let's you reuse your existing web app

Runtime loads instantly

Utilizes Native best practices

**Usage**

*AKA: Demo Time*

## Existing Project?

```
npm install @capacitor/core -S  
npm install @capacitor/cli -D  
npx cap init
```

[github.com/capacitor-community](https://github.com/capacitor-community)

In good company

SWÖRKIT

## **Parting Thoughts**

Reduce code users have to write

Provide full native access, with the web

Don't hide the native projects

**Thank you**
